

New hall for profile lamination

November 2019

The construction of a new profile lamination hall, which is located in the western part of the production area, is being finalized.

The new production hall is approximately twice as large as the original one, which will allow more efficient handling and storage of both profiles intended for lamination and better storage of already laminated profiles.

By this step PRAMOS, a.s. responds to the current increased demand for HORIZONT PS laminated profiles.

The convenient location next to the new profile warehouse completed earlier this year will improve the transport of profile pallets and improve the overall maturing conditions of the final products.

The new solution for managing the conditions under which the profiles are produced and which significantly influences the quality of the overall production of the HORIZONT PS profile system will also contribute significantly to the improvement of production and thus product quality.
